# UCI Adult Income Dataset - Data cleaning and Preprocessing

In this notebook, we focus on data preparation, cleaning, and preprocessing for the UCI Adult Income Dataset, a popular dataset often used for classification tasks predicting whether an individual earns more or less than \$50,000 annually based on demographic and work-related attributes. Good data preprocessing is crucial for reliable and interpretable results in machine learning and analytics workflows. Here, we address common data issues such asmissing values, duplicates, and inconsistent categorical labels while creating derived features to improve downstream analysis. .

We start by importing essential Python libraries for data handling and manipulation.

- pandas for structured data operations.
- numpy for numerical operations.
- os for interacting with the operating system and directory structures.

#### **Define and Create Directory Paths**

To ensure reproducibility and organized storage, we programmatically create directories for:

- raw data
- processed data
- results
- documentation

These directories will store intermediate and final outputs for reproducibility.

```
#Impor Libraries
import pandas as pd
import numpy as np
import os
```

```
#Get working directory
current_dir = os.getcwd()
#go one directory up to root directory
project_root_dir = os.path.dirname(current_dir)
#Define path to data files
data_dir = os.path.join(project_root_dir, 'data')
raw_dir = os.path.join(data_dir, 'raw')
processed_dir = os.path.join(data_dir, 'processed')
#Define path to results folder
results_dir = os.path.join(project_root_dir, 'results')
#Define path to results folder
docs_dir = os.path.join(project_root_dir, 'docs')
#Create directories if they do not exist
os.makedirs(raw_dir, exist_ok=True)
os.makedirs(processed_dir, exist_ok=True)
os.makedirs(results_dir, exist_ok=True)
os.makedirs(docs_dir, exist_ok=True)
```

#### Read in the data

We load the **Adult Income dataset** as a CSV file.

Key considerations here are:

- We treat? as missing values (na\_values = '?').
- We use skipinitialspace = True to remove extra spaces after delimeters which is common in text-based datasets.

After loading, we inspect the first few rows.

```
adult_data_filename = os.path.join(raw_dir, "adult.csv")
adult_df = pd.read_csv(adult_data_filename, header = None, na_values='?', skipinitialspace= 'adult_df.head(10)
```

	0	1	2	3	4	5	6	7
0	39	State-gov	77516	Bachelors	13	Never-married	Adm-clerical	Not-in-famil
1	50	Self-emp-not-inc	83311	Bachelors	13	Married-civ-spouse	Exec-managerial	Husband
2	38	Private	215646	HS-grad	9	Divorced	Handlers-cleaners	Not-in-famil
3	53	Private	234721	$11 \mathrm{th}$	7	Married-civ-spouse	Handlers-cleaners	Husband
4	28	Private	338409	Bachelors	13	Married-civ-spouse	Prof-specialty	Wife

	0	1	2	3	4	5	6	7
5	37	Private	284582	Masters	14	Married-civ-spouse	Exec-managerial	Wife
6	49	Private	160187	9th	5	Married-spouse-absent	Other-service	Not-in-famil
7	52	Self-emp-not-inc	209642	HS-grad	9	Married-civ-spouse	Exec-managerial	Husband
8	31	Private	45781	Masters	14	Never-married	Prof-specialty	Not-in-famil
9	42	Private	159449	Bachelors	13	Married-civ-spouse	Exec-managerial	Husband

We also inspect the dataset's shape. We see that the data has 32,561 rows and 15 columns.

# adult\_df.shape

(32561, 15)

In addition, we check the data types using .info.

#### adult\_df.info()

<class 'pandas.core.frame.DataFrame'>
RangeIndex: 32561 entries, 0 to 32560
Data columns (total 15 columns):

#	Column	Non-Null Count	Dtype
0	0	32561 non-null	int64
1	1	30725 non-null	object
2	2	32561 non-null	int64
3	3	32561 non-null	object
4	4	32561 non-null	int64

14	14	32561 non-null	object

dtypes: int64(6), object(9)

memory usage: 3.7+ MB

## Data cleaning

## Assign proper columns name

One of the most stricking things from the above inspection is that the dataset lacks explicit column headers. We manually assign descriptive meaningful column names based on the description of the dataset. This is critical for readability and interpretability in the subsequent steps.

```
adult_df.columns = ['age', 'workclass', 'fnlwgt', 'education', 'education_num', 'marital_state
adult_df
```

	age	workclass	fnlwgt	education	education_num	marital_status	occupation
0	39	State-gov	77516	Bachelors	13	Never-married	Adm-clerical
1	50	Self-emp-not-inc	83311	Bachelors	13	Married-civ-spouse	Exec-manager
2	38	Private	215646	HS-grad	9	Divorced	Handlers-clean
3	53	Private	234721	11th	7	Married-civ-spouse	Handlers-clean
4	28	Private	338409	Bachelors	13	Married-civ-spouse	Prof-specialty
32556	27	Private	257302	Assoc-acdm	12	Married-civ-spouse	Tech-support
32557	40	Private	154374	HS-grad	9	Married-civ-spouse	Machine-op-in
32558	58	Private	151910	HS-grad	9	Widowed	Adm-clerical
32559	22	Private	201490	HS-grad	9	Never-married	Adm-clerical
32560	52	Self-emp-inc	287927	HS-grad	9	Married-civ-spouse	Exec-manageri

#### Understanding the dataset

Before proceeding with the cleaning, we would like to understanding the variables deeply. This would help guide the cleaning process. The subsequent tables detail the types, meaning and values or ranges of the variables in the dataset.

Table 1: Summary table of the variables in the dataset

Variable	Type	Description	Values / Range (excluding nan)
age	Numeric	Age in years	17 - 90
fnlwgt	Numeric	Final sampling weight	$\sim 12,\!285-1,\!484,\!705$
education_num	Numeric	Education level in years	1-16

Variable	Type	Description	Values / Range (excluding nan)
capital_gain	Numeric	Capital gain amounts (Profit from selling assets above purchase price within the survey year (in USD))	0 - 99,999
capital_loss	Numeric	Capital loss amounts (Loss from selling assets below purchase price within the survey year (in USD))	0 - 4,356
hours_per_week	Numeric	Weekly work hours	1 - 99
workclass	Categorical	Type of employment	8 categories
education	Categorical	Highest level of education achieved	16 categories
$marital\_status$	Categorical	Marital status	7 categories
occupation	Categorical	Type of job	14 categories
relationship	Categorical	Relationship within household	6 categories
race	Categorical	Ethnic/racial group	5 categories
sex	Categorical	Gender	2 categories
native_country	Categorical	Country of origin	41 categories
income	Categorical	Income category (target variable)	2 categories: <=50K, >50K

Table 2: Categorical Variables Table | Variable | Unique Value | Description | :--- | | workclass | Private | Works for a private, for-profit company | | | Self-emp-not-inc | Self-employed without incorporated business status | | | Self-emp-inc | Self-employed with an incorporated business | | Federal-gov | Employed by the federal government | | State-gov | Employed by a state government | | | Local-gov | Employed by a local government | | | Without-pay | Works without receiving pay (e.g. unpaid family worker) | | | Never-worked | Has never worked in their lifetime | | education | Bachelors | Bachelor's degree | | | Some-college | Some college courses completed, no degree | | | 11th | 11th grade completed | | | HS-grad | High school graduate | | | Prof-school | Professional school (e.g. law, medicine) | | | Assoc-acdm | Associate degree (academic) | | | Assoc-voc | Associate degree (vocational) | | 9th | 9th grade completed | | 7th-8th | 7th or 8th grade completed | | | 12th | 12th grade, no diploma | | | Masters | Master's degree | | | 1st-4th | 1st to 4th grade completed | | 10th | 10th grade completed | | Doctorate | Doctoral degree | | | 5th-6th | 5th or 6th grade completed | | | Preschool | Preschool education | marital-status | Married-civ-spouse | Married, living with spouse | | Divorced | Divorced legally | | | Never-married | Never married | | | Separated | Separated legally but not divorced | | Widowed | Spouse deceased | | Married-spouse-absent Married, spouse not present (e.g. estrangement) | | | Married-AF-spouse | Married to a spouse who is a member of the Armed Forces | occupation | Tech-support | Technical support jobs | | Craft-repair | Skilled manual trade and repair jobs | | | Other-service | Services not classified elsewhere | | | Sales Sales-related jobs | | | Exec-managerial | Executive and managerial roles | | | Prof-specialty |

Professional specialty occupations (e.g. scientist, lawyer) | | | Handlers-cleaners | Manual labor jobs involving cleaning, handling objects | | | Machine-op-inspct | Machine operators, inspectors | | Adm-clerical | Administrative and clerical jobs | | Farming-fishing | Agriculture, farming, fishing occupations | | | Transport-moving | Transport and moving equipment operators | | | Priv-house-sery | Private household service jobs | | | Protective-sery | Protective service jobs Female spouse | | | Own-child | Biological or adopted child | | | Husband | Male spouse Not-in-family Not part of a family unit (e.g. living alone) | | Other-relative | Other relative in household | | Unmarried | Single person, not married | | race | White | White | | | Asian-Pac-Islander | Asian or Pacific Islander | | | Amer-Indian-Eskimo | American Indian or Eskimo | | Other | Other race not listed | | Black | Black | sex | Female | Female | | Male | Male | | native-country | United-States, Cambodia, England, Puerto-Rico, Canada, Germany, Outlying-US(Guam-USVI-etc), India, Japan, Greece, South, China, Cuba, Iran, Honduras, Philippines, Italy, Poland, Jamaica, Vietnam, Mexico, Portugal, Ireland, France, Dominican-Republic, Laos, Ecuador, Taiwan, Haiti, Columbia, Hungary, Guatemala, Nicaragua, Scotland, Thailand, Yugoslavia, El-Salvador, Trinidad-Tobago, Peru, Hong, Holland-Netherlands income | < =50 K | Income less than or equal to USD 50,000 | | | >50 K | Income greater than USD 50,000 |

```
np.unique(adult_df.race.to_list())
```

#### 2. Deal with Missing values

# adult\_df.isnull().sum()

age	0
workclass	1836
fnlwgt	0
education	0
education_num	0
marital_status	0
occupation	1843
relationship	0
race	0
sex	0
capital_gain	0
capital_loss	0

```
hours_per_week 0
native_country 583
income 0
dtype: int64
```

Using .isnull().sum(), we identify columns with missing values. They are:

- workclass with 1,836 missing values
- occupation with 1,843 missing values
- native\_country with 583 missing values

We address these by:

- Imputing categorical missing values with Unknown for the columns workclass and occupation
- Imputing categorical missing values with Other for the column native\_country

This has been done to preserve data consistency while acknowledging uncertainity.

```
adult_df['workclass'] = adult_df['workclass'].fillna('Unknown')
adult_df['native_country'] = adult_df['native_country'].fillna('Other')
adult_df['occupation'] = adult_df['occupation'].fillna('Unknown')
```

```
adult_df.isnull().sum()
```

```
0
age
                   0
workclass
fnlwgt
                   0
education
                   0
                   0
education_num
marital_status
occupation
                   0
relationship
                   0
                   0
race
                   0
sex
                   0
capital_gain
capital_loss
                   0
hours_per_week
native_country
                   0
income
dtype: int64
```

We inspect one more time to ensure we don't have any missing values.

# 3. Removing Duplicates

Duplicates can distort statistical summaries and model performance. Using .duplicated().sum(), we count duplicate records.

```
adult_df.duplicated().sum()
```

24

We then inspect the duplicated records.

# adult\_df[adult\_df.duplicated(keep=False)]

Finally, we remove them with .drop\_duplicates().

```
adult_df = adult_df.drop_duplicates()
```

We can confirm that we have no duplicates left in the dataset at this juncture

```
adult_df.duplicated().sum()
```

0

We also inspect the current shape of the dataset and see that we have 32,537 rows and 15 columns.

```
adult_df.shape
```

(32537, 15)

## **Standardize Categorical Variables**

#### Remove any leading or trailing spaces and convert the strings to lowercase

To prepare categorical variables for consistent processing, we first of all remove extra spaces and convert them to lowercase. This step ensures categorical variables are clean and consistently organized.

```
categorical_cols = adult_df.columns[(adult_df.dtypes == object)]
for col in categorical_cols:
    adult_df.loc[:, col] = adult_df[col].str.strip().str.lower()
```

### adult\_df

	age	workclass	fnlwgt	education	education_num	marital_status	occupation
0	39	state-gov	77516	bachelors	13	never-married	adm-clerical
1	50	self-emp-not-inc	83311	bachelors	13	married-civ-spouse	exec-manageria

#### Re-code the workclass column

We map the workclass column to broader categories like government, private, self-employed, etc. Table 3: Re-encoding of the workclass column

Old categories	New Categories
state-gov	government
local-gov	government
federal-gov	government
self-emp-not-inc	self-employed
self-emp-inc	self-employed
never-worked	unemployed
without-pay	voluntary

#### Re-code the education column

We create a new column education\_level with broader education groups. The mapping from education to education\_level is as follows:

Table 4: Mapping from education to education\_level

Education Level
tertiary
tertiary
tertiary
tertiary
some college
associate
associate
secondary-school graduate
secondary
secondary
secondary
secondary

Education	Education Level
7th-8th	primary
5th-6th	primary
1st-4th	primary
preschool	preschool

```
adult_df['education'].unique()
```

```
adult_df.loc[:, "education-level"] = adult_df["education"].map({
    "bachelors": "tertiary",
    "masters": "tertiary",
    "doctorate": "tertiary",
    "prof-school": "tertiary",
    "assoc-acdm": "associate",
    "assoc-voc": "associate",
    "hs-grad": "secondary-school graduate",
    "12th": "secondary",
    "11th": "secondary",
    "10th": "secondary",
    "9th": "secondary",
    "7th-8th": "primary",
    "5th-6th": "primary",
    "1st-4th": "primary",
    "preschool": "preschool",
    "some-college": "some college"
})
```

```
C:\Users\User\AppData\Local\Temp\ipykernel_9720\2360935065.py:1: SettingWithCopyWarning: A value is trying to be set on a copy of a slice from a DataFrame.

Try using .loc[row_indexer,col_indexer] = value instead
```

See the caveats in the documentation: https://pandas.pydata.org/pandas-docs/stable/user\_guidatult\_df.loc[:, "education-level"] = adult\_df["education"].map({

#### adult\_df.columns

```
Re-code the marital_status column
```

The categories inmarital\_status are simplified into single, married, divorced or separated and widowed. See Table 5 for details.

'some college', 'associate', 'primary', 'preschool'], dtype=object)

Table 5: Re-encoding of the marital\_status column

array(['tertiary', 'secondary-school graduate', 'secondary',

Old categories	New categories	
never-married	single	
married-civ-spouse	married	
married-spouse-absent	divorced or separated	
divorced	divorced or separated	
separated	divorced or separated	
married-af-spouse	married	

'married-af-spouse': 'married'})

#### adult\_df['marital\_status'].unique()

#### Re-code the occupation column

A new column, occupation\_grouped, is created. This new column groups the occupations into the categories white collar, blue collar, service, unknown and military. The exact map ping is illustrated in Table 6.

Occupation	Occupation Grouped
adm-clerical	white collar
exec-managerial	white collar
handlers-cleaners	blue collar
prof-specialty	white collar
other-service	service
sales	white collar
craft-repair	blue collar
transport-moving	blue collar
farming-fishing	blue collar
machine-op-inspct	blue collar
tech-support	white collar
protective-serv	service
armed-forces	military
priv-house-serv	service
unknown	unknown

#### adult\_df['occupation'].unique()

```
adult_df.loc[:,'occupation_grouped'] = adult_df['occupation'].map({
    'adm-clerical': 'white collar',
    'exec-managerial': 'white collar',
    'handlers-cleaners': 'blue collar',
    'prof-specialty': 'white collar',
    'other-service': 'service',
    'sales': 'white collar',
    'craft-repair': 'blue collar',
    'transport-moving': 'blue collar',
    'farming-fishing': 'blue collar',
    'machine-op-inspct': 'blue collar',
    'tech-support': 'white collar',
    'protective-serv': 'service',
    'armed-forces': 'military',
    'priv-house-serv': 'service',
    'unknown': 'unknown'
})
```

```
C:\Users\User\AppData\Local\Temp\ipykernel_9720\1699013811.py:1: SettingWithCopyWarning:
A value is trying to be set on a copy of a slice from a DataFrame.
Try using .loc[row_indexer,col_indexer] = value instead

See the caveats in the documentation: https://pandas.pydata.org/pandas-docs/stable/user_guidadult_df.loc[:,'occupation_grouped'] = adult_df['occupation'].map({
    adult_df['occupation_grouped'].unique()
```

#### Re-code the relationship column

We normalize the race column to indicate roles within a family or individual status.

Table 7 shows the re-encoding:

Table 7: Re-encoding of the race column

Old relationship	New relationship
wife	female spouse
own-child	child
not-in-family	single
other-relative	extended relative
unmarried	single
husband	male spouse

```
adult_df['relationship'].unique()
```

#### Re-code the race column

We standardize the race column to have more clear names. Table 8 shows the record values that were re-encoded:

Table 8: Re-encoding of the race column

Old categories	New categories	
asian-pac-islander	asian or pacific islander	
amer-indian-eskimo	american indian or eskimo	

#### Re-code the native\_country column

We create a new colum native\_region which maps native\_country to geographical regions (e.g., north america, asia, etc.). The mapping is as follows:

```
array(['white', 'black', 'asian or pacific islander', 'american indian or eskimo', 'other'], dtype=object)
```

#### Re-code the native country column

We create a new colum native\_region which maps native\_country to geographical regions (e.g., north america, asia, etc.). The mapping is as follows:

Table 9: Mapping from native\_country to native\_region

native_country	native_region
united-states	north america
canada	north america
puerto-rico	north america
<pre>outlying-us(guam-usvi-etc)</pre>	north america
mexico	north america
cuba	central america
jamaica	central america
honduras	central america
dominican-republic	central america
